Drivers Today

- Access to large volumes of data
- Computer power
- Especially parallelisation with GPUs
- New hardware e.g. as Google's tensorboards

WHERE DO WE STAND? – SOME PERSPECTIVES.

DATA SCIENTISTS' PERSPECTIVES

How do you feel about programming?

BTW, it takes five minutes to hack any super-secure system worldwide to access any information, video-cameras or bank accounts. * **

** on TV only, sorry ** fails miraculously if one tries to reveal Raymond Reddington's real identity*

The background of the slide is a complex, abstract pattern of overlapping, semi-transparent yellow and orange geometric shapes, primarily hexagons and lines, creating a sense of depth and movement. The colors transition from bright yellow to a darker orange, with some areas appearing more saturated than others.

How does an (AI)|(Data |(Science|Enigneer)) Expert look like?

SUPERSTAR?

Data Scientists' & AI Engineers' Backgrounds

- New job descriptions created in accelerated digitalisation era
- Data Scientist job title invented just in 2008
- Master Students & PhDs from academia
- Physics, math, new specialized curriculums
- Many lateral entrants „Seiteneinsteiger“

Data Science Roles & How They Interact

Enable data access & utilization & enable value capture

Builds and supports the infrastructure or 'data pipe' and all associated SW engineering infrastructure tasks.

Data Engineer

Core skills:

Collect, manage, analyze & visualize data
Build, deploy data infrastructure & architecture

Journey Maps
Value Streams & Service Maps
Deployment & Integration

Core skills:

Help the business make better decisions through data

Blend of business, analytic and math skills to explore and solve challenges, bridging the data and business communities.

Business Stakeholder

Data Scientist

Core skills:

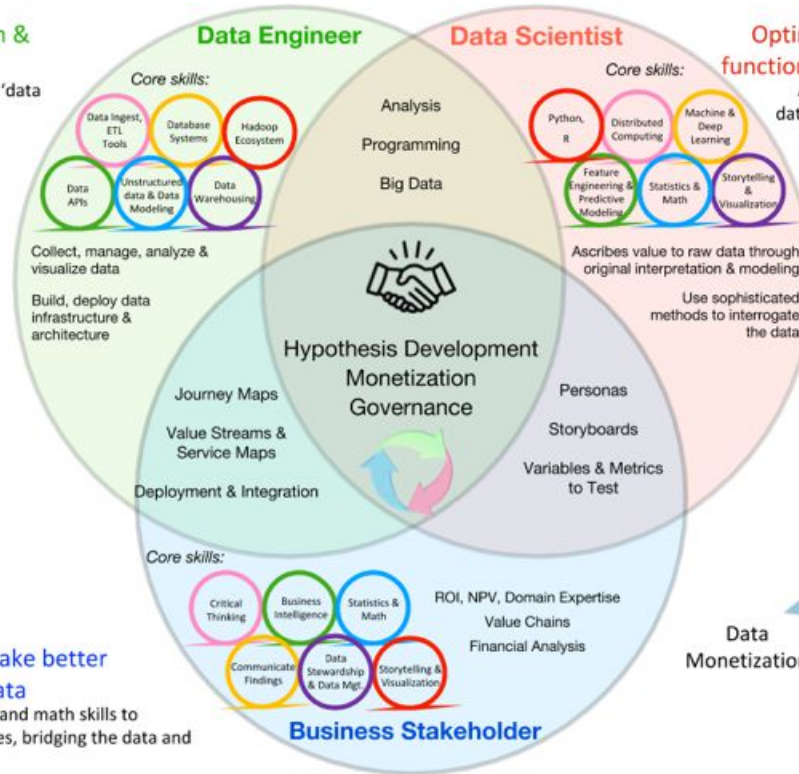

Ascribes value to raw data through original interpretation & modeling
Use sophisticated methods to interrogate the data

Personas
Storyboards
Variables & Metrics to Test

Optimize & enable data for business & functional value capture & value creation

Analysis and interpretation of complex digital data to extract or discover knowledge and assist decision-making.

Machines do not care

Interview with Margaret Boden in German
Zeit Magazine (top 5 national newspaper)

Assumptions

1. The singularity is coming 2045 (F
"Maschinen ist alles egal" – Ir
<https://www.zeit.de/zeit-magazin/2018/36>

ZEITmagazin: Many contemporaries see these advances with concern. They are frightened of a world where machines dominate people. The inventor and futurologist Ray Kurzweil, now director of technical development at Google, even claims that **superhuman artificial intelligence is near**. Around the year 2045, it will become reality. Do you believe him?

Boden: I asked him if he actually believes what he writes.

ZEITmagazin: And?

Boden: He really believes it.

ZEITmagazin: Can you dismiss Kurzweil as a spinner?

Boden : no. He has done an extraordinary job for the advancement of technology. I use the word genius very rarely. With Kurzweil I would be ready for it. Maybe someday there will be an artificial intelligence superior to us. But certainly not in this century. Things are a lot more complicated than people imagine. Kurzweil's prediction is just crazy.

The Unreasonable Effectiveness of Recurrent Neural Networks

May 21, 2015

There's something magical about Recurrent neural network for Image Caption (arbitrarily-chosen hyperparameters) the edge of making sense. Sometimes out of it blows past your expectations. It was that the common wisdom I've in fact reached the opposite conclusion. I've witnessed their power and robustness. This post is about sharing some of the

Shakespeare

It looks like we can learn to spell English words. But how about if there is more structure and style in the data? To examine this I downloaded all the works of Shakespeare and concatenated them into a single (4.4MB) file. We can now afford to train a larger network, in this case lets try a 3-layer RNN with 512 hidden nodes on each layer. After we train the network for a few hours we obtain samples such as:

PANDARUS:

```
Alas, I think he shall be come approached and the day  
When little srain would be attain'd into being never fed,  
And who is but a chain and subjects of his death,  
I should not sleep.
```

Second Senator:

```
They are away this miseries, produced upon my soul,  
Breaking and strongly should be buried, when I perish  
The earth and thoughts of many states.
```

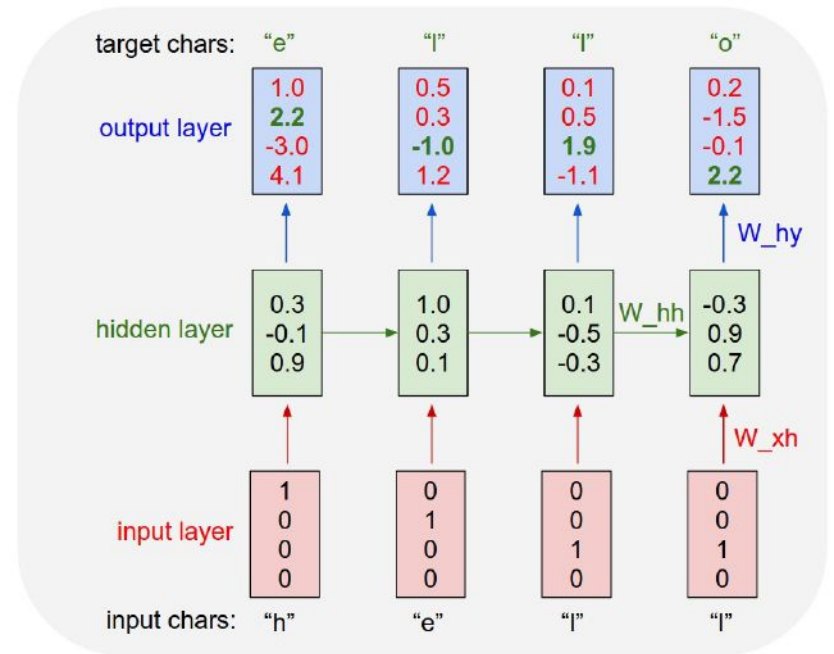

<http://karpathy.github.io/2015/05/21/>

Process

- Fan-made transcripts from PDF
- pre-processing with textract
<http://textract.readthedocs.io/en/latest/index.html>
- Identify characters via names other fan page
296 unique names identified
- German language, **1.521.382** words, **56.674** unique

Process with RNNs

- Verified produced something *Shakespearey*
- Fed with the dialogue corpus

Passing a Chicken through an MNIST Model

14 Mar 2018

When you put a picture of a chicken through a model trained on [MNIST](#), the model is 99.9% confident that the chicken is a 5. That's not good.

This problem does not just relate to chickens and digits but the fact that a neural net makes very confident predictions on data that does not come from the same distribution as the training data. While this example is artificial, it is common in practice for a machine learning model to be used on data that is very different from the data it was trained on. A self-driving car, for example, may encounter an unusual environment that was never seen during training. In such cases, the system should not be overly confident but instead let the driver know that it is not able to make a meaningful prediction.¹

Breaking Linear Classifiers on ImageNet

Mar 30, 2015

You've probably heard that Convolutional Networks work very well in practice and across a wide range of visual recognition problems. You may have also read articles and papers that claim to reach a near "human-level performance". There are all kinds of caveats to that (e.g. see my G+ post on [Human Accuracy is not a point, it lives on a tradeoff curve](#)), but that is not the point of this post. I do think that these systems now work extremely well across many visual recognition tasks, especially ones that can be posed as simple classification.

Yet, a second group of seemingly baffling results has emerged that brings up an apparent contradiction. I'm referring to several people who have noticed that it is possible to take an image that a state-of-the-art Convolutional Network thinks is one class (e.g. "panda"), and it is possible to change it almost imperceptibly to the human eye in such a way that the Convolutional Network suddenly classifies the image as any other class of choice (e.g. "gibbon"). We say that we *break*, or *fool* ConvNets. See the image below for an illustration:

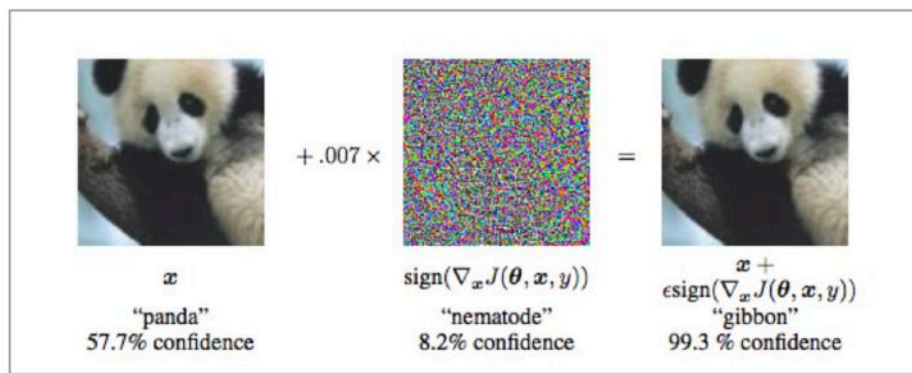

Figure from [Explaining and Harnessing Adversarial Examples](#) by Goodfellow et al.

The <http://karpathy.github.io/2015/03/30/breaking-convnets/> et al.

last year. They had a very similar set of images:

NUMFOCUS SPONSORED PROJECTS

Algo Rites
Highly Innovative
Algorithmic Data Science

Raise your hand if you use at least one of these projects every day.

Logos: pandas, PyMC3, Julia, @pen Journals, JUMP, @open Journals, sunpy, yt, etc.

Q: How long does it take?

- Training a model depends on:
 - complexity
 - data-volume
 - data-density / task (text, image)
 - hardware

Q: How long does it take? No. 2

- Training:
time and resource intensive (minutes to months)
- Application, model serving:
fast, almost instantly

Q: Why Does it Sometimes Not Work?

- Non sufficient data quality
- Heterogeneous data
- Biased datasets

Q: What is a Model?

- Python, a pickle file – object saved to disk
- ONNX - open ecosystem for interchangeable AI models
<https://onnx.ai>

Q: Pro Tips?

- Document properly
- Code properly, esp. code that works also outside of Jupyter notebooks
- Data versioning
- Think
- Domain expertise
- Challenge yourself, is DL the right approach and why
- DevOps skills to access computing power

Thank you!
